

“Didactics, education, collective intelligence, new environments,  
training and learning methods.

New Horizons in Education, in Training and in Research”

CONSTRUCTION OF KNOWLEDGE & TRAINING SYSTEMS  
Call for papers

3rd and 4th December 2015  
ESPE Strasbourg

---

This call for papers is part of the confluence of several disciplines and fields: Information Science and Communication, Educational Sciences and Didactics, Computer Science and Digital Technologies, work-focused analysis within different professional contexts. It is clearly assigned to multi-referenced view (Ardoino 1993), a multi-disciplinary, interdisciplinary and broad-based approach.

Supported by the active members of IDEKI Network ((Information-Education-Didactics-Culture-Innovation-Engineering), the research community encompassing practices, and outline the compartments fields of educational research, training, teaching and education, (Lebeaume, 2014).

It is organized in accordance with the key educational issues of LISEC (Laboratoire Interuniversitaire des Sciences de l'Education et de la Communication) which stands for the research in Educational Science and Information Science and Communication focused on the learning spaces, the education and training schemes. "The research in Education has to reinvent construction areas, building methods and learning spaces" (Chalmel, 2013). LISEC develops also synergies between university laboratories, learned societies, associations and professional circles.

The colloquium, designed as workspaces, may transcend category-based and institutional divides focusing on joint research objects. They attempt to connect research to the professional activity dimensions *in order to share knowledge* by crossing the guidelines in didactic(s): the epistemological, praxeological, educational and psychological. « The idea of the need to take into account multiple spaces and different times in construction of knowledge, is more so than the requirement of the research than the development of professional knowledge » (Morandi, 2013).

For Information Sciences and Communication and the Educational Sciences, the major concerns are to develop collective intelligence in communities of practice.

This may designate intelligence working groups (Levy, 1997); community's cognitive skills related to the multiple interactions within the group (Rogalski, 2005); an approach that may consist of a contribution to knowledge organization, building knowledge and skills (Frisch, 2014).

The social web and the consumer-centred paradigm in the mid-2000s, led the web designers to consider the information systems relating to the individual's involvement or participation (collaborative indexation, shared and collaborative research...).

« This way the user has the opportunity to develop knowledge resources throughout a group setting or collective context. This is the era of interaction and action rather than just document-based consultation » (EL Hachani, 2014).

It involves conducting the research in Didactics and Educational Sciences which will be focused on interdisciplinary approaches, namely human contact profession exchanges.

Contemporary forms of post humanity lead us to define the concept of "human contact profession" (Paragot, 2013), in particular the extension of the expression « Impossible Professions » due to the difficulties, the unthought related to intersubjectivity as constitutive elements in every profession as much as the media seeks to help users to embark on the relationship with the object (knowledge, common good, care).

We must also consider the interaction between paradigms in other scientific disciplines such as knowledge organisation in Information and Communication Science. The developments in the field of digital technologies indeed have an impact on the evolution of indexing models, organising contents, digital documents, and their uses. (Sidhom, 2013).

Societal transformations related to digital evolution, successive reforms and legislative changes have a significant impact on the professional sectors and their practices, which relates to the issue of how these changes should be considered for professionals in charge of the structures involved.

The research, education and training areas see their framework of intervention expanded and at the same time the diversification of knowledge networks and building methods of knowledge create a situation that obliges them to design new training schemes.

The 2015th symposium comes in continuity of two previous ones and may be considered as a key moment of a third programme.

In 2012, the first symposium entitled "Didactics, Human Professions and their Relevance: New Spaces and Training Schemes in Question, New Horizons in Education and Research: Research Objects and Practices in Hatcheries", focused its work **on emergences**.

The second symposium held in 2013 under the theme of "Didactics and Human Profession: New Spaces and Training Devices in Questions, New Horizons in Education and Research: Research Objects, Education and Problematized, Tensioned and Redesigned Training " placed the topic on **the pathways**.

In two years, we raised the issue of collaborative working as intended by IDEKI<sup>4</sup>, it means we enriched and studied it. We established the tools and / or techniques, and on the other hand we enabled reflective postures, with the professional challenge of building something socially constructed and shared. (Zapata, 2014).

It all goes back to our contribution to new professional paradigms, new constructions of knowledge and training schemes interlinked with the research.

We elicited new concepts (oriented activities, accentuated professionalism, interconnected skills, info-diversity, reflective effectiveness...) and developed "models" and modelling to think and to act (implementation /non-implementation, integration of interactive white board in teachers' practices, from the inclusion of the concept to inclusive practices, teaching methods and accentuated professionalism...).

Innovation, and not only mediation, as a process of creating, in terms of new input, activities, concepts and models were initiated here (Frisch, 2014).

These two movements will always be presented at the future symposium. We would like to open on a third movement by focusing on the construction of knowledge and innovative training and research devices with the intellectual and digital technologies and integrating an intercultural dimension. Analysing and developing new learning areas that are also in the line with the "guiding situations of work" (Reuter, (Dir.) 2013), are also at stake.

The aim is to emphasize **the successful constructions** in order to propose this new title: "**Didactics, Human Professions, Collective Intelligence: Construction of Knowledge and Teaching Devices**".

And the research issue is: **what kind of knowledge construction, learning situations, education and training schemes are required to build a collective intelligence and/or with the digital technology?**

Taking into account the constant changes, we can therefore ask the following questions :

### **1. Effectiveness / appropriation**

**What forms of effectiveness is needed?** A performative, procedural, metacognitive or reflective effectiveness? (Benabid-Zarrouk, 2015). Forms of assessments based on performative effectiveness suited with human professions v/s production professions. What issue of temporality is required to integrate effectiveness into professional skills?

**What are the outcomes of appropriations?** How does each of us build his own professionalism? What kind of media is used? What forms of support are most appropriate, what working methods and what kind of documentation? And through what "combination of artefacts"? (Marquet, 2013).

## **2. Relationship between school and society**

### **What is the relationship with knowledge at school?**

False pretences about learning but the extraordinary human adventures related to the authentic relationship to real knowledge. What sort of anthropology of what is learnt at school after the digital technology wave? (Levine & Develay, 2003). The relationship to knowledge and the ways of learning in the current learning situations...

**What is society's relationship with knowledge?** Following the launch of the « slow food », the « slow learning »? How to avoid new media advertising in order to spark different forms of debates, comprehension, understanding and otherness ?

**Which migration of traditional knowledge for society?** Habits should be (re) built in the relationship with oneself, the relationship to knowledge, the relationship with other people, one's relationship to the world (Morin, 2000).

## **3. Constructing interconnections**

What role will science of education and information-communication have in society related to an interdisciplinary field? Can these categories, meta-knowledge, rhizomes (Deleuze, 1980), conceptual fields (Vergnaud, 1980), concepts (Astolfi, 2008), new models (Hassan & Lahanier-Reuter, 2013; Galluzzo -Dafflon, Rosine, 2015) be developed to clearly increase renovated and effective connections?

## **4. Communities and intercultural practices**

**What kind of communities of shared and shareable practices in a cultural and intercultural dimension?** How does the concept of Media of technical-cultural interactions (Debray, 2001) and media spheres help us think of new community or societal levels?

To what extend do « didactic of Information-Documentation » (Frisch, 2014), « the document in the light of the digital environment » (Pedauque, 2006), « a documentation of educational practices » (Perla & Schiavone, 2013), « new digital media » (Gossin, 2013; Piquard-Kipffer, 2010) and « information literacy » (Maury, 2013) contribute to renewing teaching practices?

How does school cope with digital literature and in particular with youth digital literature? (Gossin, 2014)

**This symposium provides recurrent orientations and these issues tackle the following questions:**

*The first orientation is “ IDEKI new space and new challenges to build and innovate in Didactics”. Today's constructs of education, concepts, models and modelling.*

*The second is “IDEKI new space and new challenges for transition culture of information to a knowledge construction and a knowledge organisation”.*

*The third “IDEKI new space and challenges for a tailored didactic and accentuated professionalism to people with learning difficulties (in particular with digital technology)”.*
